                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10^8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p60HER-2 which lacks the transmembrane and intracellular domains of CC mreast contains ECD I. II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIIA receptor. The peptides, which bind to an HER-2 ECD, and the cucleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is human p68HER-2 generic protein CC containing ECDIIIa variant sequence.

                                                                                                                                                                        The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGFR) expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to a naturally occurring inhibitor of HER-2 receptor tyrosine kinase called herstatin. The co-
                                                                                                                                      expression of herstatin with p185HER2 causes a striking reduction in cell growth that corresponds with suppression of p185 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10^8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated 58HER-2 which lacks the transmembrane and intracellular domains of pl85HER-2 but contains ECD I, II of the pl85HER-2 and the novel ECDIIa. The ECDIIIA-contains ECD I, II of the pl85HER-2 and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIA variant sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clinton G, Henner WD,

Herceptin, at an affinity of at least 10-8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated 96HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I. II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nording related the profile of the product of the profiles.
                              Human p68HER-2 generic protein variant 6.

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of
                                         p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Clinton G,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 solid tumour; cancer; polymorphism; cytostatic; gene therapy;

```
The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10~8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC MRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CP 185HER-2 and the containing ECD I. II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the notelic acids encoding these are useful to treat, diagnose and identify containing ECDIIIa variant sequence is human p68HER-2 generic protein CC containing ECDIII variant sequence.

CC Note: The present sequence.

CC Note: The present sequence is not shown in the specification but is certain decreased in the specification of the sequence listing (AAE09181).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CP 185HER-2 but containing ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is human p68HER-2 generic protein CC containing ECDIIIa variant sequence.

CC Note: The present sequence is not shown in the specification but is CC derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIII a variant sequence.
solid tumours. The present sequence is human containing ECDIIIa variant sequence.

Note: The present sequence is not shown in the
                                                                                                                                                                                                                                                                                                       Clinton G,
                                                                                                                                                                                                            Example 11; Page -; 61pp; English

                                                                                                                            8
                                                                                                                                                        Вb
                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                γ
                                                                                                                                                                                                                                                                                   The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised cantibody, Herceptin, at an affinity of at least 10°8: The present CI invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated CC p88HER-2 which lacks the transmembrane and intracellular domains of CP 185HER-2 but containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the culcic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein CC Note: The present sequence is now in the specification but is containing ECDIII variant sequence.

Note: The present sequence (SEQ ID NO:2) shown in the containing (AAE09181).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10^8. The present cinvention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated CC p6HER-2 which lacks the transmembrane and intracellular domains of CP HESHER-2 which lacks the transmembrane and intracellular domains of CP HESHER-2 which lacks the transmembrane and intracellular domains of CC containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the culties encoding these are useful to treat, diagnose and identify containing ECDIII a variant sequence is human p68HER-2 generic protein CC containing ECDIII a variant sequence.

CC Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:13) shown in the containing (AAEO9183).

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence.

Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the

epidermal growth factor receptor precursor - chicken
N;Contains: protein-tyrosine kinase (EC 2.7.1.112) erbB
C;Species: Gallus gallus (chicken)
C;Date: 28-Feb-1986 #sequence_revision 05-May-1995 #text_change 04-Feb-2000
C;Accession: A27720; A00643

"Cloning and activation of the Syrian hamster neu proto-oncogene.";
Gene 140:251-255(1994).
-i- FUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COMPLEX,
ALTHOUGHT NEUREGULINS DO NOT INTERACT WITH IT ALONE: GP30 IS A
POTENTIAL LIGAND FOR THIS RECEPTOR. NOT ACTIVATED BY EGF, TGF-
ALPHA AND AMPHIREGULIN (BY SIMILARITY).
-i- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                         PROSITE; PRO0107; PROTEIN_KINASE_ATP; 1.
